

INSULATION FLANGE GASKET

Insulation Flange Gasket

Insulation Flange Gaskets are installed worldwide in numerous pipeline systems, where they perform an essential role in the isolation of the flow of electric current.

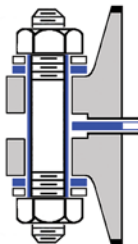

Service:

They are used in pipeline flanges which use two different materials for the sake of anticorrosion and to protect the conduction of electricity and suitable for hydrocarbon, insulate the chemical product etc.

Type E

Suitable for raised & flat flanges. The use of gasket reduces the risk of electrical bridging and the ingress of foreign matter between the flanges.

Type F

Suitable for raised flanges, and uses a central gasket which is located inside the bolt circle of the flange. It may be regarded as a "drop in" gasket.
